

SIKAD

1. DASAR

```
<?php
function gagal() {
    echo $_err = ErrorMsg("Login Gagal", "Login dan Password yang Anda masukkan tidak valid.<br>
    Hubungi Administrator untuk informasi lebih lanjut.<hr size=1 color=black>
    Pilihan: <a href=?nme=$_REQUEST[nme]&mnux=login&lid=$_REQUEST[lid]&lgn=frm'>Login</a> | <a
href=?mnux=>Kembali</a>");
}
function berhasil() {
    global $_ProductName, $_Version;
    // Tampilkan welcome
    TampilkanJudul("Selamat Datang");
    echo Konfirmasi("Selamat Datang", "Selamat datang di $_ProductName<hr size=1 color=silver>
    Nama : <b>$_SESSION[_Nama]</b><br>
    LevelID : <b>$_SESSION[_LevelID]</b><br>
    Institusi : <b>$_SESSION[_KodeID]</b><br>
    <hr size=1>
    Pilihan: <a href=?slnt=loginprc&slntx=lout'>Logout</a>");
}
function cek() {
    global $arrID;
    $_tbl = GetaField('level', 'LevelID', $_REQUEST['lid'], 'TabelUser');
    $_Institusi = $_REQUEST['institusi'];
    $s = "select * from $_tbl where Login='$_REQUEST[Login]' and KodeID = '$_REQUEST[institusi]' and NA = 'N' and
Password=LEFT(PASSWORD('$_REQUEST[Password]'),10) limit 1";
    $r = _query($s);
    $_dat = _fetch_array($r);
    if (empty($_dat)) {
        $_SESSION['mnux'] = 'login';
        $_REQUEST['lgn'] = 'gagal';
    }
    else {
        $sid = session_id();
        // Set Parameter
        $_SESSION['_Login'] = $_REQUEST['Login'];
        $_SESSION['_Nama'] = $_dat['Nama'];
        $_SESSION['_TabelUser'] = $_tbl;
        $_SESSION['_LevelID'] = $_REQUEST['lid'];
        $_SESSION['_Session'] = $sid;
        $_SESSION['_Superuser'] = $_dat['Superuser'];
        $_SESSION['_ProdiID'] = $_dat['ProdiID'];
        $_SESSION['_KodeID'] = $_Institusi;
        $_SESSION['_KodeID'] = $_Institusi;
        $_SESSION['mnux'] = 'login';
        $_REQUEST['lgn'] = 'berhasil';
    }
}
function lout() {
    ResetLogin();
    $_SESSION['mnux'] = 'logout';
}
?>
```

2. Kelemahan

```
$s = "select * from $_tbl where Login='$_REQUEST[Login]' and KodeID = '$_REQUEST[institusi]'
and NA = 'N' and Password=LEFT(PASSWORD('$_REQUEST[Password]'),10) limit 1";
$r = _query($s);
$_dat = _fetch_array($r);
if (empty($_dat)) {
    $_SESSION['mnux'] = 'login';
    $_REQUEST['lgn'] = 'gagal';
}
```

3. Cara mengatasi

- Hindari penggunaan tanda petik tunggal (') dengan menggunakan fungsi REPLACE, seperti dibawah ini:

```
p_strUsername = Replace(Request.Form("txtUsername"), "'", "")
p_strPassword = Replace(Request.Form("txtPassword"), "'", "")
```

- b. Mengganti Error message (yang default)
- c. Batasi hak akses
